## Question 1 (2 Marks)

Download the fashion-MNIST dataset and plot 1 sample image for each class as shown in the grid below. Use `from keras.datasets import fashion_mnist` for getting the fashion mnist dataset.

## Question 2 (10 Marks)

Submitted the code in moodle

## Question 3 (24 Marks)

Code Submitted in Moodle

## Question 4 (10 Marks)

Wandb provides different 3 methods to do Hyperparameter Sweeping which are Random , bayes and grid .

Grid Search tries every combination of the hyperparameter

Random Search Select each new combination at random according to provided distributions

Bayesian Search creates a probabilistic model of metric score as a function of the hyperparameters, and choose parameters with high probability of improving the metric .

I have choosen bayesian Search as it is computatioally effective and uses a probabilistic approach to find the best set of hyperparameter that can maximize the Validation Accuracy

 hidden\_layer:5\_mini\_batch\_size:32\_activationstanh Sweep: 7vl3rumo 1  
 hidden\_layer:5\_mini\_batch\_size:16\_activationstanh Sweep: 7vl3rumo 1

- I got a maximum Validation Accuracy of around **88.82 %**.
- The minimum Validation Accuracy is around **9.95 %**

## Question 6 (20 Marks)

1. The highest validation Accuracy is **88.82% without Regularization** . The configuration was nadam,n\_layers = 4 ,s\_hidden\_layer = 64 , batch\_size = 32,lr = 1e-3,Xavier Initialization , epochs = 10 ,tanh activation.
2. The lowest Validation Accuracy Observed was around **9.95% without Regularization** . The configuration was mgd,n\_layers = 5 ,s\_hidden\_layer = 128 , batch\_size = 64,lr = 1e-2,Xavier Initialization , epochs = 10 ,tanh activation.
3. When I grouped the sweep based on Optimiser that gave the best validation Accuracy , I observed that most gave best result with Xavier Initialization.
4. When filtered with group of Validation Accuracy and Optimiser Together , nadam and adam came in the top - 20 list. Most of the activation function was tanh , learning rate of 1e-2 , hidden layer of 4 or 5 with Xavier Initialization was most common observation. This states the fact that nadam and adam are the best optimizer.(Note: nag and rms\_prop came into the list).
5. Based on the Correlation Plot , n\_hidden\_layer is a parameter of importance which necessarily had a positive correlation to maximize the validation Accuracy
6. nadam,sgd,nag,mgd were the optimizer which gave validation accuracy below 65% . Eventhough nadam gave highest validation , maybe the learning rate of 1e-4,sigmoid activation and size of hidden layer could have made it performance degrade.
7. Definitely nadam, adam can be used as optimizer configuration to get more than 95% with Regularization and Data Augmentation Added. The below two plots are plots that does not involve Regularization.

**Val Accuracy with Optimizers**  
Showing first 10 bars

optimiser: nadam Sweep: 7vl3rumo 1

- Now based on the "Correlation Summary" , we can see that `n_hidden_layers` is having a positive correlation on the validation Accuracy . Therefore on increasing the `n_hidden_layers` in the network , the accuracy may increase.
- Tanh Activation based on the "Parallel co-ordinates plot" and a "correlation summary" have shown to increase the validation Accuracy . This has a higher positive correlation than `n_hidden_layers`
- The nadam optimizer as expected tends to have positive correlation . This could vary from different configuration used.
- Epoch has little importance and have a negative correlation. This could mean that increasing the number of epoch could be computationally expensive and may end in regions where the loss is very high.
- The adam optimizer tends to work for certain configuration based on "Correlation Summary" . But it is of least important. This is also the case with `rms_prop`.
- Xavier Initialization works best for all the parameter configuration

Parameter importance with respect to val\_Accuracy

## Question 7 (10 Marks)

For the best model identified above, report the accuracy on the test set of fashion\_mnist and plot the confusion matrix as shown below. More marks for creativity (less marks for producing the plot shown below as it is)

- The best model configuration identified is nadam with  $n\_layers = 4$ ,  $s\_hidden\_layer = 64$ ,  $batch\_size = 32$ ,  $lr = 1e-3$ , Xavier Initialization, epochs = 10, cross-entropy loss and tanh activation.
- We can see that most shirt got mispredicted as T-shirt and some as Pullovers and Coats
- T-shirts, Pullovers and Coats are similar to each other. Therefore there are mispredictions for these classes.

## Question 8 (5 Marks)

In all the models above you would have used cross entropy loss. Now compare the cross entropy loss with the squared error loss. I would again like to see some automatically generated plots or your own plots to convince me whether one is better than the other.

- I ran Sweep with cross entropy loss and squared error loss as parameters
- We can see that the cross entropy loss performed better than squared error loss wrt to Validation Accuracy. Hence we can say that cross entropy loss is better.

## ▼ Question 9 (10 Marks)

[https://github.com/sandeepkumarsuresh/cs6910\\_assignment1](https://github.com/sandeepkumarsuresh/cs6910_assignment1)

## Question 10 (10 Marks)

- Based on my understanding from the experimentation of Fashion MNIST Dataset . I would work on
  1. Optimiser : Constraining it to adam, nadam and nag
  2. Activation Function: tanh , relu or sigmoid
  3. Number of Hidden Layer: 3,4,5
- The highest Validation Accuracy for MNIST Dataset is **97.31%** .
- The Configuration-1 for **97.31%** is adam optimiser,tanh activation,batch=16,epoch =5,lr=1e-3,Xavier Initialization,n\_hidden layers =3 , s\_hidden\_layer =128
- The Configuration-2 for **97 %** nadam optimiser,tanh activation,batch=64,epoch =5,lr=1e-3,Xavier Initialization,n\_hidden layers =4 , s\_hidden\_layer =128
- The Configuration-2 for **96.7%** nag optimiser,relu activation,batch=32,epoch =5,lr=1e-3,Xavier Initialization,n\_hidden layers =4 , s\_hidden\_layer =128
- Interestingly we can see that the relu function also had a correlation in getting accuracy above 95%.
- From this experiment what I observed is that based on the data we have , certain activation function will provide better result.In the Fashion MNIST Dataset , tanh activation gave better result .

val\_Accuracy v. created
